TRANSPIRE

How to raise a build contract with Claude

Give Claude the build contract request email and it sets the job up in OnSite Companion, then fills in the contract documents for you, using Transpire's own templates off the `Z:` drive, not something it made up. It saves the finished documents into the job folder and hands you a review sheet. Every OnSite Companion change waits for your Yes, and nothing is ever sent, signed or issued without you.

EVERYDAY GUIDE · CONTRACT ADMINISTRATION · UPDATED 27 OCTOBER 2026

It uses the real template, every time. Claude opens the same blank document you would open from `Z:\PROCEDURES & FORMS\CONTRACTS` and types into it. The wording, the styles, the inclusions list and the page numbering are left exactly as they are. Only the fields change. It has been taught which template belongs to which region (Tamworth and Gunnedah jobs share one; Sydney and SEQ have their own), which folders are superseded, and which fields to fill, from the **Raising Contracts** section of the System and Procedures Manual. **It will never invent a contract format.** If it can't find the right template it stops and tells you.

Start here: five steps

1. Open **Claude Desktop** and sign in with your own account.
2. Switch to **Code** mode.
3. Pick the project folder `transpire-claude-code`.
4. Accept the folder-trust prompt. **Once only.**
5. Type `/new-contract-template` and point it at the request email.

The folder to pick in step 3 is `Z:\CLAUDE CODE\transpire-claude-code`. Browse to it once and Claude remembers it. Steps 1 to 4 are a one-off; after that you land straight on step 5 each time. For the email, the surest way is to **drag the email out of Outlook into the chat** (or save it into the job's CONTRACT DOCUMENTATION folder and say so): Claude then opens every attachment itself — the EOI form, the ID, the inclusions, the plans. Pasting the subject line also works: Claude finds the message and reads the chain and any picture attachments from the mailbox, but the mail connection cannot hand over PDF or Word attachments, so for those it will ask you, once, to drag the email in. It never needs you to type what is already in an attachment. **Start a new chat for each job** so it picks up the latest instructions.

Where the documents go: four rules

1. **It looks in the job folder first.** Before filling anything, Claude checks the job's `CONTRACT DOCUMENTATION` folder under `Z:\PROJECTS` and notes which contract documents are already there: inclusions, preliminary agreement, build contract.
2. **A document the job does not have yet is a real contract.** Its Word file and PDF are saved straight into that `CONTRACT DOCUMENTATION` folder. It never goes to the testing folder.
3. **A document the job already has is treated as a re-run.** The new copy goes only to the testing folder (`Z:\CLAUDE CODE\cowork-projects\3.new_contract\template-testing\<job>`). The original in the job folder is never overwritten. If the new one is right, you move the old one into the folder's `SS` subfolder and copy the new one across.
4. **The build contract is produced too, every time.** Until the manager files the approved Word contract in the templates folder, Claude fills from the team's own Word build and saves it under the real file name. The report tells you which template it used; a person reads the draft against the licensed HIA PDF before it is issued.

This is decided document by document. On a job that already has its inclusions but no build contract yet, one run puts the inclusions re-run in the testing folder and the build contract straight into the job folder. The run report prints a line per document saying where it went.

What happens when you run it

1 It reads the whole email chain, and the attachments

Including the EOI and, if the marketer sent one, the ID. The ID is optional: without it the names come off the EOI form and the report flags them for a spelling check.

WHAT IT PULLS OUT

- The buyer's name, from the EOI, not from an email signature
- Design, façade and contract price
- Whether the EOI is marked dual key
- Anything the sales manager asked for: a review first, no prelim agreement, a changed price

Why this matters: these emails get forwarded two or three times. The instruction to you is in the newest part, the job facts are in the oldest part from the marketer. It reads all of it.

EOIs and IDs. The marketers' online EOI form is read in full — first, middle and last names, address, mobiles, emails, house plan and price come straight out of the form's typed fields (since 24 September 2026; before that the form looked blank to Claude and people typed it in). A photographed EOI or ID is read as a picture. Only a scan with no text and no picture in it cannot be read on this server, which has no OCR; then Claude names the exact fields it needs. Type them exactly as on the ID, and check the spelling on the finished document yourself.

2 It sets the job up in OnSite Companion

Since 13 October 2026 these changes go into the OnSite Companion you use every day. Before that date they went to a test copy you could not see, so anything Claude said it had entered in OSC before 13 October is not there.

WHAT IT DOES IN OSC

- Searches the lot first, so an existing job is never created twice
- Creates the client and the job: region, generated contract number, the Pre Sales Investor v1 template
- Fills the job details from the EOI: site address, design and façade, property type, local council, legal and marketer details
- Ticks activities 1 and 2, and attaches the request email to the job and to task 11 with the subject NEW JOB
- Adds the purchasers as contacts with mobile and email, ticks them as primary, and adds the sales and marketer contacts

YOU ARE ASKED AT MOST THREE TIMES, ONCE PER STAGE

- **New client and job.** After the lot search, one check covers both.
- **Setting up the job.** One check covers the job details, the contacts, activities 1 and 2, the NEW JOB email on the job and task 11, and, on a new job, the job folder on `Z:`.
- **DataBuild done.** When you say so, one check covers activity 6.
- Everything else (reading the email, the searches, the documents) goes ahead without asking.

EACH CHECK LOOKS LIKE THIS

```
Job: 26999 - LOT 12 SAMPLE STREET, TESTVILLE NSW 2000
2 changes, made in this order:
1. Job details
   - Site address, suburb: now “TESTVILLE”, will be “BOX HILL”
2. Activity 1 “Initial Contact” is marked complete
   - Completion date: now empty, will be 15 Oct 2026
Nothing else on these records changes.
Already in OnSite Companion, so left out: activity 2 is already complete.
Reply “yes” to make all 2 changes, or “no” to leave OnSite Companion as it is.
```

- Check the job number and address first. If it is the wrong job, say no.
- “now” is what OSC holds today; “will be” is what it changes to. “will be cleared” means the value is removed.
- A **Warning** line needs your eye: another job on the same lot and suburb, or a client or person who may already be in OSC. If it is the same buyer or job, say no and tell Claude which one to use.
- Reply **yes** to make every change in the list, or **no** to leave OSC alone. If you want something different, say what; Claude shows you a new check, and nothing changes until you say yes to that one.
- Then click **Allow** on the approval box. It shows the same confirmation code as the check.

You get back: after each yes, Claude reads every change back from OSC and tells you it is done, or exactly what did not take. If something in the list changed in OSC part-way, Claude stops there, the changes before it stay done, and you get a new check for the rest. You also get the job’s contract number, which becomes the job number for the folder and the documents.

DataBuild is still yours. Claude never opens it, and never puts the contract price into OSC (the price lives in DataBuild only). Enter the job in DataBuild as you do now, then tell Claude “DataBuild done” and it ticks activity 6, *Create Job within Databuild*. Anything OSC’s API has no field for, such as Client Notes, is listed for you to type in.

3 It finds the job folder and picks the template

And tells you both, before it fills anything in.

You get back: the job folder it found on `Z:` (it also checks the completed and cancelled folders, and warns you if a cancelled job sits at the same lot), the full path of the blank template it is about to use, and a line per document saying whether that document will go to the job folder or the testing folder. If the job folder does not exist yet, Claude asks you before creating it.

It knows what is out of date. Anything in an `SS` folder is superseded, and there are a lot of them. It also skips files marked "don't use" and any template named for a different marketer or estate. If two templates could both be right, it asks rather than guessing.

4 It fills the documents and saves them

Inclusions, the preliminary agreement if the job needs one, and the build contract.

THE FIELDS IT COMPLETES

- Inclusions: lot, street, suburb, estate, price, house type, house size, façade, garage side, client names, site address, Builders Representative
- Build contract: cover page (owners, job, lot, site), the owner block, the land details, the signature names and the owner acknowledgement names
- Owner address, mobiles, emails, DP number and land address, when the request gives them

You get back: each document as a finished `.docx` and its PDF, saved per the four rules above, plus a list of exactly what changed against the blank template so you can see it touched the fields and nothing else.

Signatures, dates and initials are left empty. Always. Signing is yours and Michael's. **Build contract money (NSW from 15 October 2026, QLD from 27 October 2026):** Claude works out the price excluding GST, the GST, the deposit and every progress payment from the contract price, the same way the signed contracts do, and shows the sums in its report. Check them. If DataBuild has different figures, give them to Claude and they are used instead.

5 It tells you what it could not fill

This is the part worth reading properly.

TYPICAL FLAGS

- "Corner block: Sample Road and Example Street on the site plan; the driveway street couldn't be read, confirm the garage side"
- "The plans haven't arrived, so house size is blank"
- "This job already has inclusions, so the new inclusions went to the testing folder; the build contract went into the job folder"
- "Owner names were typed in by you, not read from the ID. Check the spelling"
- "Dual key: the standard inclusions have no second-dwelling section. Someone needs to write it"

You get back: a short review sheet listing every field, where each value came from, every blank, and every flag. It also lists the values you still need to key in yourself (see the checks below).

Before anything is issued: your checks

1. **Read the build contract against the licensed HIA PDF once.** The Word template is the team's own build and is still waiting on the manager's formal sign-off, so this read-through is your safety check on layout and wording.
2. **Check the owner names and spelling.** Against the ID when there is one; against the EOI form when there is not (the report flags "no ID in the request"). If it says the EOI was typed into the chat rather than read, check those names twice.
3. **Check the money.** Read the contract figures in the report (GST, deposit, each progress payment) against DataBuild, on NSW and QLD contracts alike.
4. **Finish the OSC job.** Do the DataBuild entry yourself and tell Claude it is done, so activity 6 gets ticked. Type in any Client Notes the report lists.
5. **Fill what is still blank.** Owner address, every purchaser's mobile and email (DocuSign needs all of them), DP number, land address and any guarantor details stay empty until someone supplies them.
6. **Dual key and plans.** On a Sydney auxiliary job, check the AUX DWELLING upgrade lines as closely as the main ones; outside Sydney the auxiliary dwelling text is still yours to write. House size and garage side wait for the plans; confirm the building period category.
7. **Check the report's route lines** so you know which documents are in the job folder and which are in the testing folder waiting to be moved across. Claude never issues, sends or signs anything.

Filling in the blanks afterwards

WHAT YOU HAVE	WHAT TO DO
Owner contacts, DP number, land address, guarantor, house size, garage side, and any DataBuild figure that differs from Claude's	**Tell Claude the values in the same chat and ask it to run the job again.** Say them plainly: "Lot 142: owner mobile is …, second owner email is …, DP number is …, garage side is left, price excluding GST is …". Because the job folder already has the document, the new version lands in the testing folder (rule 3). Check it, move the old one into `SS`, copy the new one across.
QLD DataBuild figures that differ from Claude's: contract price, GST, deposit and progress payments	**Give them to Claude whenever you have them**, before or after the run. Claude already fills item 2 and the progress payments (Part B) from the contract price; your figures replace its own. Type them in the chat, or paste a screenshot of the DataBuild screen. Claude reads a screenshot's numbers back to you and uses them once you say they are right. Nothing waits for them. Your figures go in exactly as you gave them, and Claude tells you if anything does not add up. If the documents are already saved, only the build contract is filled again, and it lands in the testing folder (rule 3): check it, move the old one into `SS`, copy the new one across.
Special conditions, a contract change the request did not approve on its own line, auxiliary dwelling inclusions text outside Sydney, a building period different from the template	**Edit the `.docx` in Word yourself.** Claude will never write these. Type them in, then save a fresh PDF (File, Save As, PDF) so the Word file and the PDF stay together under the same names. Move the old pair into `SS`.
A wrong or misspelt owner name	Either way works: correct it in Word and re-save the PDF, or give Claude the exact name and re-run.
The PDF only	Never edit the PDF. It is only an export of the Word file. Change the Word file, then export again.

What it will never do

- **Never** invent contract wording of its own, or a contract format. It fills the company's template or it stops. The one thing it writes per job is the Sydney UPGRADED INCLUSIONS section, and there the words come from the Standard Variation spreadsheet; it shows you the row it picked and how sure it is, and anything it could not match is marked for your approval. **Approved changes (from 15 October 2026):** when the request marks a change "Approved" on the same line, Claude makes three kinds itself: a new late-payment interest rate, striking a whole NSW contract clause, and adding or removing words in a preliminary agreement clause the request quotes. The report lists each one as applied or refused, with the request line. Anything else the request asks to change is listed for you to do.
- **Never** guess a number that goes in a contract. Price, house size and garage side are either sourced or flagged for you. The preliminary agreement fee is the standard amount unless the request names another.
- **Never** sign, initial or date anything, and never send an email or issue anything to DocuSign.
- **Never** change OnSite Companion without showing you the change first and getting your yes, and never change anything outside the new-job set-up (no deleting, no emails from OSC, no contract price). Never open DataBuild.
- **Never** overwrite a file that is already in a job folder. A document the job already has is re-run into the testing folder for you to check and move across; only documents the job does not have yet are saved straight in.

It still stops and asks when a real decision is needed: a price that doesn't match the EOI, two templates that could both fit, whether the job needs a preliminary agreement, or whether to create a job folder that does not exist yet.

What it produces, and what it doesn't

DOCUMENT	WHAT YOU GET
Inclusions	**Filled in, ready to check.** The real Word template with all the fields completed. **Sydney (from 10 September 2026):** the job's content too. Section 18 keeps only the area that applies (Box Hill and Gables, North Kellyville, or everywhere else), the red Bathroom 2 and air-conditioning notes are dealt with, the upgrades from the request are written into UPGRADED INCLUSIONS in the Standard Variation wording, and everything is black except the blue package headings. It then re-levels the two columns in Word and checks its own work (labels level, headings at the top of their pages, no blank page, nothing red or highlighted) before it will save. The report lists every upgrade line with the spreadsheet row it used and a confidence mark; check the medium and low ones. **Auxiliary jobs (from 15 October 2026):** the same for both dwellings, with the MAIN DWELLING and AUX DWELLING upgrades each written into their own section.
Preliminary agreement	**Filled in**, when the job needs one. Claude asks whether the job needs it. The standard fee is used unless the request names a different one.
Build contract	**Filled in and saved into the job folder.** Claude fills the cover page, the owner block, the land details and the signature names on the team's Word version of the licensed NSW or QLD contract, and exports the PDF (45 pages for NSW, 37 for QLD). The report names the template it used. It also works out the GST, deposit and progress payments from the contract price and shows the sums. Read it against the licensed HIA PDF before it is issued.
Plans, general conditions, colour options	Not produced. Listed as a checklist so nothing is forgotten from the pack.

Everything it hands you is a draft. Read it against the email, the ID and the plans before it goes anywhere. It is quick and it is careful, but it has not seen the site, spoken to the client, or opened DataBuild.

Getting a good draft

DO THIS	WHY IT HELPS
Give Claude the email itself: drag it from Outlook into the chat, or into the job folder	The EOI form's typed values, the ID and the plans all come out of the attachments. The mail connection alone can pass on the text and pictures, not PDFs
Give the owner contacts and land details up front	Address, mobiles, emails, DP number and land address go straight onto the build contract instead of being blanks to fill later
Wait for the plans if you can	House size and garage side come off the plans and nowhere else
Say if it is a dual key or auxiliary dwelling	It needs the auxiliary template, and each upgrade has to be marked for the main or the second dwelling. Saying so up front saves a round trip
Give the job number if you have it	Lot numbers repeat across estates; job numbers do not
Read the flags before the document	The flags tell you whether the document is usable yet

If something goes wrong

PROBLEM	FIX
"I can't see the Z: drive"	The task is running in the cloud. Start again in **Code** mode on your computer.
It says OSC writes are switched off	The OSC connection starts fresh with every chat, so a chat opened before the switch reached it (or opened outside the `transpire-claude-code` folder) still sees it off. Close the chat, start a new one in that folder and run again — that is the whole fix; nobody has to restart a server or a computer. If a brand-new chat still says off, tell the team: the switch lives in the project's settings file and is changed through a reviewed change, not from a chat. Meanwhile Claude keeps the OSC changes as a draft and still produces the documents.
It shows the check again and asks once more	Someone changed that record in OSC after you said yes, or the change itself is different now. Nothing was sent. Read the new check and answer it.
It says OSC looks like an out-of-date copy	Claude will not write to an OSC whose newest job is over a month old, because that means it is not connected to the system you use. Nothing was changed. Tell the team.
It found a job at the same lot in OSC	It stops on purpose. Tell it whether that is the same job (it then continues with it) or a different one.
Activity 6 is still pending in OSC	Claude ticks it only after you say the DataBuild entry is done. Say so in the same chat.
It says the template has changed	Take this seriously. Somebody has revised the blank template, so Claude stopped rather than produce a half-filled contract. Tell the team; it needs a small update before it will run again.
The build contract went to the testing folder, not the job folder	The job folder already had a build contract, so this run was a re-run (rule 3). Check the new one, move the old pair into `SS`, and copy the new pair across.
Claude asked me for the owner names	For the marketers' online EOI form or a photographed EOI this should not happen any more. First check Claude actually has the email file — drag it from Outlook into the chat — and ask it to read the EOI's form fields. Only a scan with no text and no picture is unreadable here (no OCR on this server); then type the names exactly as on the ID and check the spelling on the finished document.
It left garage side blank	Working as intended. Claude reads it off the site plan drawing and will not guess. The flag names the streets it found: check the drawing, fill it in yourself, or ask Michael. On a Sydney corner block or a lot with a lane it writes "Via" and the street the driveway uses, the way the team does.
The build contract has no prices in it	The request had no contract price Claude could use, and the report says so: give Claude the price and ask it to run the job again. On QLD you can also give it the DataBuild figures, typed or as a screenshot (see "Filling in the blanks").
It says a file is "open in another program"	You (or someone) have the old PDF open. Close it and tell Claude to re-run the delivery. Nothing needs re-typing.

PROBLEM	FIX
It says the price on the email and the EOI disagree	It stops on purpose. Don't pick one; get it confirmed.
An upgrade landed under the wrong dwelling	Tell Claude which dwelling the line belongs to and ask it to run the job again. An upgrade with no dwelling marked goes under MAIN DWELLING and the report flags it.
The report says an amendment was REFUSED	Claude could not match it exactly: the request line had no "Approved" of its own, the contract did not read what the request said it reads, or the new wording was more than added or removed words. The document keeps the template wording. Make the change in Word yourself, or fix the request and run the job again.
An upgrade line says "custom wording, a person approves it"	The request did not match any row in the Standard Variation spreadsheet, so Claude drafted the line and marked it low confidence. Read it and change it in Word if it is not right.
The Sydney run took five minutes	Normal. Word measures about a thousand paragraphs to keep the labels level with their wording, then exports the PDF.
It says the quality gate failed and nothing was saved	On purpose. A label sat off its wording, a page came out blank, or something red was left. Tell Claude; it re-runs. Do not fix the output by hand.
The job isn't where you expected	Finished and cancelled jobs move out of the live region folder. Claude checks those too; give it the job number.
I still see an old file named "TEST UNAPPROVED TEMPLATE"	That was the practice-copy name used before 8 September 2026. It is no longer produced; ignore old copies in the testing folder.

Transpire, build contract guide. Updated 27 October 2026. *Questions, or something in here is wrong? Tell the team. This guide is maintained and gets updated as the templates and the procedure change. The field rules behind it are in the project repo under* `job-roles/contract-admin/rules/contract-docs.md`*, and the template map under* `.claude/skills/new-contract-template/references/`*.*
